7 Measurable Mappings

We consider maps $T: X \to X'$ between two measurable spaces (X, \mathcal{A}) and (X', \mathcal{A}') which respects the measurable structurs, the σ -algbras on X and X'. These maps are useful as we can transport a measure μ , defined on (X, \mathcal{A}) , to (X', \mathcal{A}') .

Definition 7.0.1. Let (X, \mathcal{A}) , (X', \mathcal{A}') b measurable spaces. A map $T: X \to X'$ is called \mathcal{A}/\mathcal{A}' -measurable if the pre-imag of every measurable set is a measurable set:

$$T^{-1}(A') \in \mathcal{A}, \quad \forall A' \in \mathcal{A}'.$$
 (1)

- A $\mathcal{B}(\mathbb{R}^n)/\mathcal{B}(\mathbb{R}^m)$ measurable map is often called a Borel map.
- The notation $T:(X,\mathcal{A})\to (X',\mathcal{A}')$ is often used to indicate measurability of the map T.

Lemma 7.1. Let (X, A), (x', A') be measurable spaces and let $A' = \sigma(G')$. Then $T: X \to X'$ is A/A'-measurable iff $T^{-1}(G') \subset A$, i.e. if

$$T^{-1}(G') \in \mathcal{A}, \ \forall G' \in \mathcal{G}'.$$
 (2)

Theorem 7.2. Let (X_i, A_i) , i = 1, 2, 3, be measurable spaces and $T : X_1 \to X_2$, $S : X_2 \to X_3$ be A_1/A_2 and A_2/A_3 -measurable maps respectively. Then $S \circ T : X_1 \to X_3$ is A_1/A_3 -measurable.

Definition 7.2.1. (and lemma) Let $(T_i)_{i\in I}$, $T_I: X \to X_i$, be arbitrarily many mappings from the same space X into measurable spaces (X_i, A_i) . The smallest σ -algebra on X that makes all T_i simultaneously measurable is

$$\sigma(T_i: i \in I) := \sigma\left(\bigcup_{i \in I} T_i^{-1}(\mathcal{A}_i)\right)$$
(3)

Theorem 7.3. Let (X, A), (X', A') be measurable spaces and $T: X \to X'$ be an A/A'-measurable map. For every measurable μ on (X, A),

$$\mu'(A') := \mu(T^{-1}(A')), \quad A' \in \mathcal{A}',$$
 (4)

defines a measure on (X', A').

Definition 7.3.1. The measure $\mu'(\cdot)$ in the above theorem is called the push forward or image measure of μ under T and it is denoted as $T(\mu)(\cdot)$, $T_{*\mu}(\cdot)$ or $\mu \circ T^{-1}(\cdot)$.

Theorem 7.4. If $T \in \mathbb{R}^{n \times n}$ is an orthogonal matrix, then $\lambda^n = T(\lambda^n)$.

Theorem 7.5. Let $S \in \mathbb{R}^{n \times n}$ be an invertible matrix. Then

$$S(\lambda^n) = |\det s^{-1}| \lambda^n = |\det S|^{-1} \lambda^n.$$
 (5)

Corollary 7.5.1. Lebesgue measure is invariant under motions: $\lambda^n = M(\lambda^n)$ for all motions M in \mathbb{R}^n . In particular, congruent sets have the same measure. Two sets of points are called congruent if, and only if, one can be transformed into the other by an isometry

8 Measurable Functions

A measurable function is a measurable map $u: X \to \mathbb{R}$ from some measurable space (X, \mathscr{A}) to $(\mathbb{R}, \mathscr{B}(\mathbb{R}^1))$. They play central roles in the theory of integration.

We recall that $u: X \to \mathbb{R}$ is $\mathscr{A}/\mathscr{B}(\mathbb{R}^1)$ -measurable if

$$u^{-1}(B) \in \mathscr{A}, \ \forall B \in \mathscr{B}(\mathbb{R}^1).$$
 (6)

Moreover from a lemma from chapter 7, we actually only need to show that

$$u^{-1}(G) \in \mathcal{A}, \ \forall G \in \mathcal{G} \text{ where } \mathcal{G} \text{ generates } \mathcal{B}(\mathbb{R}^1).$$
 (7)
